Cart Lo-fi Prototype

My cart design did not change from the final paper prototype I made previously. However, some of the formatting aspects for the cart preview section changed. I decided to put in more relevant information like the cart subtotal, delivery address, estimated delivery time, etc.

Cart Lo-fi Prototype

My hi-fi cart design had information like the cart subtotal, delivery address, estimated delivery time, etc. to allow the user to easily see everything they selected and/or did not want to select, and then move on with their checkout process. I also added more styling by changing button colors to indicate their importance level (darker colors are more important buttons). For the implementation, the only part I changed was the delete button. In this hi-fi mockup, the delete button is not very visible, but the final implementation has the button as a smaller version of the 'add more items' button.
